                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes a mature human FAS Ligand Inhibitory Protein (FLINT). FLINT is a homologue of tumour necrosis factor receptor proteins. FLINT inhibits the binding of FAS to FAS ligand. The mature Protein is modified to produce analogues, which have greater potency, longer in vivo half-lives, decreased aggregation, decreased absorption onto surfaces, increased solubility and improved ease of formulation. The FLINT analogue is useful for treating a patient suffering from disease or condition relating to abnormal apoptosis such as acute lung injury, acute respiratory distress syndrome, pulmonary fibrosis, chronic obstructive pulmonary disease, ulcerative colitis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                apoptosis

The present sequence is that of cDNA coding for human FAS ligand inhibitory protein FLINT mature protein (see AAB19705). FLINT is a tumour necrosis factor receptor homologue that binds FAS ligand, preventing its interaction with FAS. This interaction is implicated in runaway apoptosis and inflammatory disease. FLINT also binds to LIGHT, a membrane-bound ligand, which may play a role in immune modulation and apoptosis. The invention relates to movel FLINT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             40
analogues (see also AAB19706-09) that are resistant to proteolysis by trypsin-like proteases between positions 218 and 219 of the FLINT mature protein sequence. Nucleic acids, vectors and transformed host cells for recombinant production of the analogues are claimed. FLINT cDNA is used as a template for introducing the required point mutations e.g. via PCR mutagenesis. The protease resistant FLINT analogues are used to prevent or treat acute lung injury, acute respiratory stress syndrome, ulcerative colitis, chronic obstructive pulmonary disease, pulmonary fibrosis, to inhibit T lymphocyte activation, and to facilitate organ preservation for transplantation (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GTGGCAGAAACACCCCACCTGCCGGGACGCAGAGACAGGGGAGCGGCTGGTGTG

Human FLINT (also known as osteoprotegrin 3) is a new tumour necrosis factor receptor (TNFR) superfamily member, which binds FasL and LIGHT and prevents FasL-Fas interaction. Mature FLINT (MFLINT) inhibits FasL-Fas mediated apoptotic and pro-inflammatory activity. WFLINT is useful for treating acute respiratory distress syndrome, treating or inhibiting ulcerative collitis, inhibiting ischemic injury during organ transplantation or for organ preservation during transplantation. MFLINT can also be used to treat acute liver failure, inflammation of the liver, abnormal (hepatocyte) apoptosis, seppis, disorders associated with inflammation, hepatitis, ischemia, hypercoagulation or reperfusion, damage to a cardiac myocyte resulting from abnormal myocardial ischaemia, type I diabetes, caneer, damage to an innocent bystander tissue induced by a chemotherapeutic or therapeutic irradiation, aplastic anaemias, myelodysplastic syndromes and pancytopenic conditions.

New FLINT polypeptide for treating and/or preventing acute lung injury, acute respiratory distress syndrome, ulcerative colitis, and graft-versus-host disease, comprises O-linked or N-linked

Example 1; Page 53; 60pp; English

The present sequence is human mature fas ligand inhibitory protein CC (FLINT) cDNA, FLINT, a homologue of tumour necrosis factor receptor CC protein (TNPR), binds fas ligand (FasL) and thereby preventing the CC interaction of FasL with fas ligand (FasL) and thereby preventing the CC oligosaccharides is useful for preventing or treating acute lung injury (ALI), acute respiratory distress syndrome (ARDS), ulcerative colicis, cc chronic obstructive pulmonary disease (COPD) and pulmonary fibrosis (PF), to facilitate organ preservation for transplantation and to inhibit T CC (MI), ischaemia, brain trauma/injury, human immunodeficiency virus (HIV), ischaemia, brain trauma/injury, chronic renal failure, graft vs-tost disease, cuteneous inflammation, vascular leak syndrome, thost disease, cuteneous inflammation, vascular leak syndrome, thost disease, cuteneous inflammation, vascular leak syndrome, collabetes mellitus (IDDM), osteoporosis, inflammatory bowel disease, cuteneous inflammatory bowel disease, sepsis, pancreatitis, cancer, autoimmune disease such as CC Crohn's disease, sepsis, pancreatitis, cancer, autoimmune disease such as

The invention relates to a new method of administering FLINT (FAS ligand inhibitory protein) or FLINT analog that involves pulmonary administration of a therapeutic amount of the FLINT or FLINT analog. The method enables systemic absorption of FLINT through lungs and significantly reduces or eliminates the need for administering FLINT by injection or other routes of administration. The method is useful in treating disorders related to enhanced apoptosis (e.g. organ failure in liver, kidneys and pancreas) and inflammatory diseases associated with neutrophil activation (e.g. sepsis, acute respiratory distress syndrome, acute lung injury, systemic inflammatory response syndrome (SIRS) and multiple organ dysfunction (MODS)). The method minimises the pain and discomfort of injection methods. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Administering FLINT (FAS ligand inhibitory protein) or FLINT analog, useful for treating e.g. sepsis or respiratory distress syndrome, involves pulmonary administration of a therapeutic amount of the FLINT or FLINT analog -

The present invention describes therapeutic applications of mature FLINT (C (mpILINT), which is a member of the tumour necrosis factor receptor (mpILINT), which is a member of the tumour necrosis factor receptor c superfamily, is used for treating acute liver failure, inflammation of the liver, abnormal hepatocyte apoptosis, sepsis, a disorder associated with inflammation, hepatitis, abnormal apoptosis, an ischaemia-associated injury or disorder such as hypercoagulation (including use with thrombolytic or anti-thrombolytic agents), reperfusion-associated injury or disorder rissue that is induced by a chemotherapeutic agent or therapeutic irradiation, treating haematopoietic progenitor cells that the therapeutic adents and the progenitor cells that canaemia, myelodysplastic syndrome or a pancytopenic condition. mpILINT is also used for promoting the growth or differentiation of a haematopoietic progenitor cell or CD34+ cell and preventing damage to a cardiac myocyte resulting from abnormal myocardial ischaemia. The present sequence is the coding sequence of the human Fas ligand inhibitor (FLINT). The FLINT protein is involved in cell-specific approass, and can be used to treat inflammatory and autoimmune diseases cuch as rheumatoid arthritis, inflammatory bowel disease, fundated lifections diseases such as HIV-induced lymphopenia, fundanent viral cheaticis B/C, chronic hepatitis and cirrhosis, and H. pylori-associated ulceration, ischaemia and reperfusion conditions including acute and atherosclerosis, and Alzheimer's and Parkinson's diseases, acute lung injury and acute respiratory distress syndrome, congestive heart failure and atherosclerosis, and Alzheimer's and Parkinson's diseases, brain crauma and injury, chronic glomerulonephritis, osteoporosis, aplastic anaemia, myelodysplasia, ulcerative collitis, Down's syndrome, and multiple sclerosis. In addition, the gene and protein can be used to prevent apoptosis following organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  147

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This DNA encodes a HUMAN NTR-1 polypeptide, a novel orphan receptor. The protein is related to osteoprotegerin (OPG) and to tumour necrosis factor receptor (TNRR). Host cells transformed with a vector comprising the HUMAN NTR-1 nucleic acid are used for the recombinant expression of the protein. HUMAN NTR-1 proteins and antibodies immuno specific for the protein are useful for diagnosis and treatment of humans and animals, especially muscle disorders, as the receptor is involved in regulation of bone mass and muscle metabolism. HUMAN NTR-1 receptors are also useful for screening for novel binding agents, and cognate ligands, which may be used to treat disorders associated with HUMAN NTR-1 imbalance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human tumour necrosis factor receptor (TNFR)-
dalpha and 6beta protein and their corresponding nucleic acids. The
invention provides screening methods for identifying agonists and
antagonists of TNFR-6alpha and 6beta activity. The invention also
provides diagnostic and therapeutic methods for detecting and treating
immune system-related disorders. The method is useful for treating or
preventing an inflammatory disease or disorder selected from bowel
disease, encephalitis, atherosclerosis and psoriasis, an autoimmune
disease or disorder selected from systemic lupus erythematosus,
arthritis, rheumatoid arthritis, multiple sclerosis, Crohn's disease,
and autoimmune encephalitis, graft versus host disease (GVHD), and an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180
```

The present sequence encodes the tumour necrosis factor (TNF) receptor polypeptide NTR3. The NTR3 polynucleotides and polypeptides are useful for treating diseases such as acquired-immunodeficiency syndrome (AIDS

diseases,

```
sick syndrome, haemorrhagic shock, hepatitis, insulin resistance, belower and prosy, loukaemia, meningitis, multiple sclerosis, myocardial ischaemia, obesity, rejection of transplanted organs, rheumatoid arthritis, septic shock syndrome, stroke, adult respiratory distress syndrome (ARDS), tuberculosis, and a number of viral diseases. The NTR3 polypeptide is beful for identifying or developing new (ant) agonists of NTR3. It may be used as an immunogen to which antibodies may be raised. NTR3 nucleic acid molecules may be useful as hybridisation probes in diagnostic assays to test, either qualitatively or quantitatively, for the presence of an NTR3 DNA or corresponding RNA in mammalian tissue or bodily fluid samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

The MGB protein is a member of a family of proteins which have roles in immune responses, cell death, cell proliferation and stimulation of cell differentiation. MGB lacks a transmembrane domain stimulation of cell differentiation. MGB lacks a transmembrane domain cand is a secreted factor suggesting that it functions as a natural implication for its ligand. The altered expression pattern of MGB in a multitude of tissues suggests that MGB may play a role in cancer by binding to its ligand and blocking apoptotic cell death induced by such a ligand. This anti-apoptopic role of MGB suggests that modulators of MGB will be useful in treatment of apoptosis-related clissases such as various forms of cancer and various bone disorders. MGB nucleic acids and proteins are therefore useful for treating conditions involving atypical apoptosis and for identifying conditions are the MGB indentifying cancer and other diseases associated with abnormal levels of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           á
                                                                                                            are expressed in endothelial cells, keratinocytes, normal prostate and prostate tumour tissue. For a number of disorders of these cells, particularly of the immune system, substantially altered (whether increased or decreased) levels of TNPR-6 alpha and/or TNPR-6 beta gene expression can be detected, therefore the TNFR-6 alpha and TNPR-6 beta polypeptides, nucleic acids and antibodies are claimed to be useful in the diagnosis of such disorders. Mutations of the TNPR-6 alpha and TNPR-6 beta genes can also be detected. The TNPR polypeptides are also claimed to be useful for identifying ligands which may be useful in the treatment of apoptosis related disorders.
                                                                                                                                                                                                                            The present sequence represents the human tumour necrosis factor receptor-6 alpha (TNFR-6 alpha) CDNA. The invention also provides for the TNFR-6 beta CDNA (AAV39086). TNFR-6 alpha and TNFR-6 beta members of the tumour necrosis factor receptor (TNFR) family. TNFR

This sequence encodes the human tumour necrosis factor receptor 6
alpha (TNFR-6alpha) of the invention. The TNFR-6alpha and TNFR-6beta DNA
and protein sequences can be used in the prevention, treatment and
diagnosis of diseases associated with inappropriate TNFR expression. The
nucleic acids, polypeptides, antibodies, agonists and antagonists against
them may be used for the treatment of a range of conditions such as
clisorders associated with neovascularisation (especially ocular
neovascularisation) (such as solid tumours and malignancies (e.g.
prostate cancer, breast cancer and colon cancer), diabetic retinopathy
and parasitic infections, bone disease (e.g. osteoporosis),
thyroid associated opthalmopathy tissue/cell damage, wounds, microbial
and parasitic infections, bone disease (e.g. osteoporosis),
characterise disorders (e.g. Alzheimer's disease),
neurodegenerative disorders (e.g. Alzheimer's disease),
disorders (e.g. graft rejection), rheumatism, liver disease,
autoimmune diabetes, asthma, psoriasis, septic shock and ulcerative
            bone disease; osteoporosis; atherosclerosis; cardiovascular disease; beurodegenerative disorder; Alzheimer's disease; immune disorder; graft rejection; rheumatism; liver disease; autoimmune diabetes; asthma; psoriasis; septic shock; ulcerative colitis; therapy; ds.

Detected at very low levels in brain, placenta and skeletal muscle. Highly expressed in fetal kidney, liver and lung. INDUCTION: Upregulated by increasing calcium-concentration in the medium and estrogens. Downregulated by glucocorticoids. PTM: N-glycosylated. Contains sialic acid residues. SIMILARITY: CONTAINS 4 TMFR-CYS REPEATS. SIMILARITY: CONTAINS 2 DEATH DOMAINS.

Bone homeostasis seems to depend on the local RAKI/OPC ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PER 92.460-470(2001).
FUNCTION: Acts as decoy receptor for RANKL and thereby neutrality function in osteoclastogenesis. Inhibits the activation of its function in osteoclastogenesis apoptosis in vitro. Bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: Homodimer.

                                                                                                  its function. Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRALL and protect against apoptosis. TRALL binding blocks the inhibition of osteoclastogenesis (By similarity).
-: SUBCELMILAR LOCATION: Secreted (By similarity).
-: INDUCTION: Upregulated by osteopontin.
-: SIMILARITY: CONTAINS 2 DEATH DOMAINS.

"Osteoprofegerin reverses osteoporosis by inhibiting endosteal osteoclasts and prevents vascular calcification by blocking a process resembling osteoclastogenesis.";
J. Exp. Med. 192:463-474(2000).
-!- FUNCTION: Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.

-:- PHARMAGENITCHAL: Available under the name Enbrel (Immunex and Wyeth.Ayerst). Used to treat moderate to server rheumatoid arthritis (RA). Enbrel consist of the extracellular ligand-binding portion of TNRR2 linked to an Immugalobulin Fc chain. It binds to TNR-alpha and blocks its interactions with receptors.
-:- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.

SUBCELLULAR LOCATION: Type I membrane protein and secreted.

PTM: Phosphorylated; mainly on serine residues and with a very low level on threonine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                            CHARACTERIZATION.

Kissonerghis M., Fellowes R., Feldmann M., Chernajovsky Y.; Submitted (WAY-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor with high affinity for TNFSF2/TNF-alpha approximately 5-fold lower affinity for homotrimeric TNFSF1/lymphotoxin-alpha (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STRAIN=NOD;

                                                                                                                                                                                                                                                                                                                                                                                                - FUNCTION: May activate NF-kappa-B and JNK and promote apoptosis.
- SUBCILIVIAR LOCATION: Type I membrane protein (Probable).
- SUBCILIVIAR LOCATION: Type I membrane protein (Probable).
- TISSUE SPECIFICITY: Highly expressed in heart, brain, placenta, pancreas, lymph node, thymus and prostate. Detected at lower levels in lung, skeletal muscle, kidney, testis, uterus, small intestine, colon, spleen, bone marrow and fetal liver. Very low levels were found in adult liver and peripheral blood leukocytes.
- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
- SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                        EMBL;

                                                               Genomics 30:312-319(1995).

-!- FUNCTION: Receptor for the heterotrimeric lymphotoxin containing LTA and LTB, and for TINES14/LIGHT. Promotes apoptosis via TRAF3 and TRAF5. May play a role in the development of lymphoid organs (By similarity).
-!- SUBUNIT: Self-associates (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R EMBL; U29173; AAA68964.1; -.
